

REMARKS

In the office action the examiner indicated that the arguments filed 10/5/2004 had features not claimed in the claims. It appears that if the features in the arguments were in the claims the claims would be allowed. Therefore the applicant has amended the claims to add the features which distinguish the invention from the prior art.

The new claims have the feature of the long central axis bore in the hole former and a long central axis tube in the invert with along bar running therethrough for alignment purposes.

The applicant believes the redrafted claim elements now make the claims allowable.
